Case 1: Splenectomy with Proximal Splenorenal Shunt

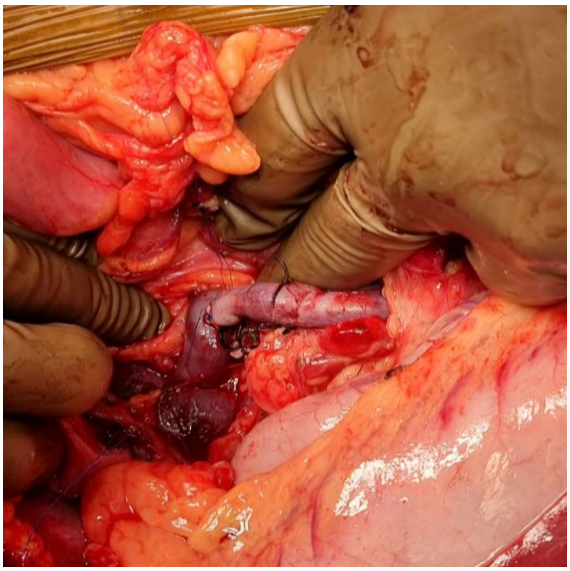

Figure 1 Image showing anastomosis between splenic vein and left renal vein

A 28year old female patient with extrahepatic portal venous obstruction (EHPVO), presenting with portal hypertension, recurrent variceal bleeding, portal biliopathy, massive splenomegaly and hypersplenism, was taken up for surgical management. The patient underwent splenectomy with proximal splenorenal shunt on 23 December 2025.

Case 2: Deceased Donor Liver Transplantation (DDLT)

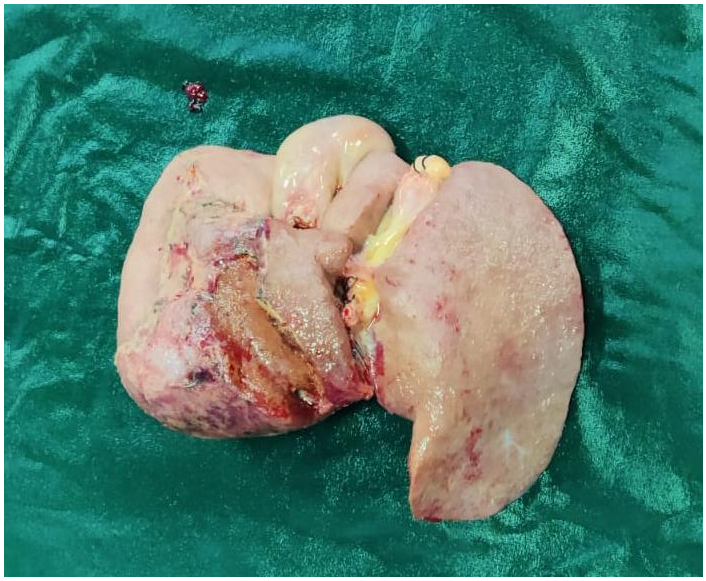

Figure 2 Explant Liver - Nodular Cirrhotic Liver

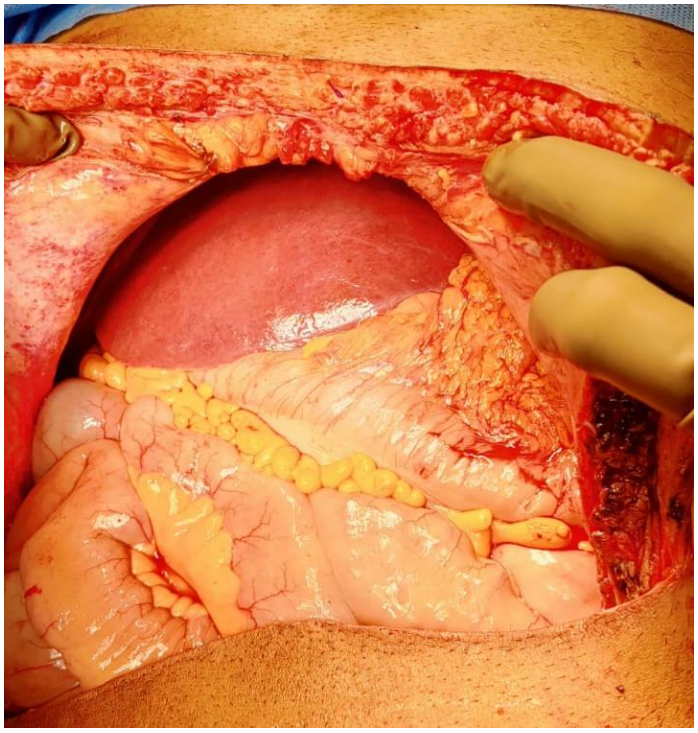

Figure 3 Implant Graft Liver

A 40-year-old male patient with decompensated chronic liver disease (DCLD), Child-Pugh score 11 (Class C) and MELD-Na score of 23, underwent deceased donor liver transplantation on 24 September 2026.
